(54) Title: IMAGING APPARATUS AND INTERMEDIATE TRANSFER BLANKET THEREFOR

**(57) Abstract**

Imaging apparatus including an imaging surface having a toner image formed thereon and an intermediate transfer member (30, 102, 104), which receives the toner image from the imaging surface and from which it is subsequently transferred. The intermediate transfer member (30, 102, 104) includes a drum (30) having mounting recesses formed therein and an intermediate transfer blanket (104) mounted on the drum (30). The blanket (104) has a layered transfer portion having a transfer surface (109) on one face thereof which receives the toner image and optionally an adhesive layer (126) on the opposite face thereof and a mounting fixture (106), attached to one edge of the layered transfer portion and adapted to mate with the mounting recesses in the drum, whereby the transfer blanket (104) is fixedly and removably mounted on the drum (30).

## 1 IMAGING APPARATUS AND INTERMEDIATE TRANSFER BLANKET THEREFOR

2 FIELD OF THE INVENTION

3 The present invention relates to image forming and  
4 image transfer apparatus especially for use in electrostatic  
5 imaging using an intermediate transfer blanket.

6 BACKGROUND OF THE INVENTION

7 The use of an intermediate transfer member in  
8 electrostatic imaging is well known.

9 Various types of intermediate transfer members are  
10 known and are described, for example in U.S. Patents  
11 3,862,848, 4,684,238, 4,690,539 and 4,531,825 and in the  
12 RELATED APPLICATIONS listed above, the specifications of all  
13 of which are incorporated herein by reference.

14 Belt-type intermediate transfer members for use in  
15 electrophotography are known in the art and are described,  
16 inter alia, in U.S. Patents 3,893,761, 4,684,238 and  
17 4,690,539, the specifications of which are incorporated  
18 herein by reference.

19 The use of intermediate transfer members and members  
20 including transfer blankets for offset ink printing is also  
21 well known. Such blankets have characteristics which are  
22 suitable for ink transfer but are generally not usable, per  
23 se, for liquid toner imaging.

24 SUMMARY OF THE INVENTION

25 The present invention seeks to provide, in one aspect  
26 thereof, improved image transfer apparatus using an improved  
27 intermediate transfer member.

28 The present invention further seeks to provide, in a  
29 second aspect thereof, an improved image transfer member for  
30 use in imaging apparatus, especially in image forming  
31 apparatus using electrostatically charged toner.

32 The present invention further seeks to provide, in a  
33 third aspect thereof, an improved image transfer blanket for  
34 use as part of the image transfer member in imaging  
35 apparatus, especially in image forming apparatus using  
36 electrostatically charged toner.

PCNS

- 2 -

1        There is thus provided in accordance with a preferred  
2 embodiment of the invention, imaging apparatus comprising:  
3                an imaging surface having an image, preferably a toner  
4 image formed thereon; and  
5                an intermediate transfer member, which receives the  
6 toner image from the imaging surface and from which it is  
7 subsequently transferred, comprising:  
8                        a drum having mounting recesses formed therein;  
9 and  
10                an intermediate transfer blanket mounted on the  
11 drum, the blanket comprising:  
12                        a layered transfer portion having a transfer  
13 surface on one face thereof which receives the toner image  
14 and preferably an adhesive layer on an opposite surface  
15 thereof; and  
16                        a mounting fixture, attached to only one  
17 edge of the layered transfer portion and adapted to mate  
18 with the mounting recesses in the drum,  
19                whereby the transfer blanket is removably mounted on  
20 the drum.  
21        In a preferred embodiment of the invention at least a  
22 portion of a surface of the layered transfer portion  
23 opposite to the transfer surface is bonded to the drum.  
24        Preferably, the layered transfer portion comprises an  
25 electrically conductive layer underlying the transfer  
26 surface; and the mounting fixture comprises an electrically  
27 conductive element, attached to one edge of the transfer  
28 portion, which is electrically connected to the electrically  
29 conductive layer.  
30        In a preferred embodiment of the invention, the  
31 electrically conductive element, which preferably comprises  
32 at least one "L" shaped finger-like extension extending  
33 therefrom, that contacts the drum, wherein the drum is  
34 electrified to a voltage which is operative to transfer the  
35 toner image from the imaging surface to the transfer  
36 surface. Preferably, said at least one "L" shaped extension

PCNS

- 3 -

1 has a first portion extending in a direction perpendicular  
2 to the layered transfer portion and a second portion  
3 attached and substantially perpendicular to the first  
4 portion and extending substantially parallel to and away  
5 from the layered transfer portion.

6 Preferably, the mounting recesses further comprise  
7 recesses therein which receive said second portion.

8 There is further provided in accordance with a  
9 preferred embodiment of the invention, a substantially  
10 rectangular intermediate transfer blanket comprising:

11 a layered transfer portion having a transfer surface on  
12 one face thereof; and

13 a mounting fixture, adapted for mounting the blanket on  
14 a drum, attached to only one edge of the layered transfer  
15 portion.

16 Preferably, the layered transfer portion comprises an  
17 electrically conductive layer underlying the transfer  
18 surface; and the mounting fixture comprises an electrically  
19 conductive element, attached to one edge of the transfer  
20 portion, which is electrically connected to the electrically  
21 conductive layer.

22 Preferably, the electrically conductive element  
23 comprises at least one "L" shaped finger-like extension  
24 extending therefrom, which extension preferably has a first  
25 portion extending in a direction perpendicular to the  
26 layered transfer portion and a second portion attached and  
27 substantially perpendicular to the first portion and  
28 extending substantially parallel to and away from the  
29 layered transfer portion.

30 In a preferred embodiment of the invention the layered  
31 transfer portion comprises a conformal layer formed of a  
32 material having a Shore A hardness of less than 65,  
33 preferably less than about 50 and more than about 30.

34 Preferably, the transfer surface is a release layer for  
35 toner.

36 There is further provided in accordance with a

PCNS

- 4 -

1 preferred embodiment of the invention, a substantially  
2 rectangular intermediate transfer blanket comprising:  
3       a layered transfer portion having a transfer surface on  
4 one face and including a conductive layer underlying the  
5 transfer surface; and  
6       a conductive element, attached to one edge of the  
7 transfer portion, which is electrically connected to the  
8 conducting layer.

9       There is further provided in accordance with a  
10 preferred embodiment of the invention, a layered  
11 intermediate transfer member and blanket comprising:

12       a transfer surface on one face; and  
13       a conforming layer having a shore A hardness of less  
14 than about 65, preferably less than about 50 and preferably  
15 more than about 30.

16       There is further provided in accordance with a  
17 preferred embodiment of the invention, a layered  
18 intermediate transfer blanket comprising:

19       a transfer surface on one face of the blanket; and  
20       an adhesive layer on the opposite face of the blanket  
21 which is stable at a temperature of at least 80°C,  
22 preferably above 100°C, more preferably above 120°C, most  
23 preferably above 150°C.

24       There is further provided in a preferred embodiment of  
25 the invention, a layered intermediate transfer blanket  
26 comprising:

27       an transfer surface on one face of the blanket; and  
28       a soft layer on the opposite face of the blanket which  
29 has a Shore A hardness of less than 90, more preferably less  
30 than 45, most preferably less than 25.

31       In a preferred embodiment of the invention the soft  
32 layer comprises an acrylic polymer.

33       In a preferred embodiment of the invention the layered  
34 transfer portion comprises an adhesive layer on a side  
35 thereof opposite to the transfer surface.

36       There is further provided in accordance with a

PCNS

- 5 -

1 preferred embodiment of the invention, imaging apparatus for  
2 performing an imaging process, comprising:

3 an imaging surface having a liquid toner image  
4 comprising toner particles and carrier liquid formed  
5 thereon; and

6 an intermediate transfer member, which receives the  
7 toner image from the imaging surface and from which it is  
8 subsequently transferred, comprising:

9 a layered transfer portion having a transfer  
10 surface on one face thereof which receives the toner image;

11 a resilient layer underlying the transfer surface  
12 which comprises a material which is at least partly  
13 leachable by the carrier liquid; and

14 a barrier layer, preferably comprising at least  
15 partially hydrolyzed polyvinyl alcohol, that is  
16 substantially impervious to the carrier liquid and is  
17 situated intermediate the resilient layer and the transfer  
18 surface.

19 There is further provided, in a preferred embodiment of  
20 the invention a layered intermediate transfer member  
21 comprising:

22 a transfer surface;

23 a resilient layer underlying the transfer surface which  
24 comprises a material which is at least partly leachable by a  
25 liquid hydrocarbon; and

26 a barrier layer, preferably comprising at least  
27 partially hydrolyzed polyvinyl alcohol, that is  
28 substantially impervious to the liquid hydrocarbon and is  
29 situated intermediate the resilient layer and the transfer  
30 surface.

31 There is further provided, in accordance with a  
32 preferred embodiment of the invention, a layered  
33 intermediate transfer member for receiving liquid toner  
34 images comprising toner particles and carrier liquid  
35 comprising:

36 a transfer surface;

PCNS

- 6 -

1 a resilient layer underlying the transfer surface which  
2 comprises a material which is at least partly leachable in  
3 the carrier liquid; and

4 a barrier layer, preferably comprising at least  
5 partially hydrolyzed polyvinyl alcohol, that is  
6 substantially impervious to the carrier liquid and is  
7 situated intermediate the resilient layer and the transfer  
8 surface.

9 There is further provided, in accordance with a  
10 preferred embodiment of the invention, imaging apparatus for  
11 performing an imaging process, comprising:

12 an imaging surface having a liquid toner image  
13 comprising toner particles and carrier liquid formed  
14 thereon; and

15 an intermediate transfer member, which receives the  
16 toner image from the imaging surface and from which it is  
17 subsequently transferred, comprising:

18 a layered transfer portion having a transfer  
19 surface on one face thereof which receives the toner image;

20 a resilient layer underlying the transfer surface  
21 which comprises a material which interferes with the  
22 operation of the imaging process;

23 a barrier layer, preferably comprising at least  
24 partially hydrolyzed polyvinyl alcohol, that is  
25 substantially impervious to the interfering material  
26 comprised in the resilient layer and is situated  
27 intermediate the resilient layer and the transfer surface.

28 In a preferred embodiment of the invention, the  
29 material is a gas and the barrier layer is a barrier layer  
30 for gasses.

31 There is further provided, in accordance with a  
32 preferred embodiment of the invention, a layered  
33 intermediate transfer member, comprising:

34 a transfer surface;

35 a resilient layer underlying the transfer surface; and

36 a barrier layer, preferably comprising at least

PCNS

- 7 -

1 partially hydrolyzed polyvinyl alcohol, that is  
2 substantially impervious to liquid hydrocarbons and is  
3 situated intermediate the resilient layer and the transfer  
4 surface.

5 There is further provided, in accordance with a  
6 preferred embodiment of the invention, a layered  
7 intermediate transfer member, comprising:

8 a transfer surface;

9 a resilient layer underlying the transfer surface which  
10 releases gases; and

11 a barrier layer, preferably comprising at least  
12 partially hydrolyzed polyvinyl alcohol, that is  
13 substantially impervious to the gasses and is situated  
14 intermediate the resilient layer and the transfer surface.

15 There is further provided, in accordance with a  
16 preferred embodiment of the invention, a layered  
17 intermediate transfer member for receiving liquid toner  
18 images comprising toner particles and carrier liquid  
19 comprising:

20 a transfer surface;

21 a resilient layer underlying the transfer surface  
22 comprising a material which is at least partly leachable in  
23 the carrier liquid; and

24 a barrier layer, preferably comprising at least  
25 partially hydrolyzed polyvinyl alcohol, that is  
26 substantially impervious to the carrier liquid and is  
27 situated intermediate the resilient layer and the transfer  
28 surface.

1 BRIEF DESCRIPTION OF THE DRAWINGS

2 The present invention will be understood and  
3 appreciated more fully from the following detailed  
4 description, taken in conjunction with the drawings in  
5 which:

6 Fig. 1 is a simplified sectional illustration of  
7 electrostatic imaging apparatus constructed and operative in  
8 accordance with a preferred embodiment of the present  
9 invention;

10 Fig. 2 is a simplified enlarged sectional illustration  
11 of the apparatus of Fig. 1;

12 Fig. 3A is a simplified, cross-sectional side view of  
13 an intermediate transfer member, including a removable  
14 intermediate transfer blanket mounted on a drum, in  
15 accordance with a preferred embodiment of the invention;

16 Fig. 3B is a partially cut-away top view of the  
17 intermediate transfer member of Fig. 3A;

18 Figs. 4A and 4B are respective top and side views of an  
19 intermediate transfer blanket in accordance with a preferred  
20 embodiment of the invention;

21 Fig. 4C shows details of the layered construction of  
22 the intermediate transfer blanket in accordance with a  
23 preferred embodiment of the invention;

24 Fig. 4D is a cut-away expanded view of a securing  
25 mechanism on the intermediate transfer blanket of Figs 4A  
26 and 4B; and

27 Fig. 5 is a simplified cross-sectional illustration of  
28 a portion of an intermediate transfer member, including a  
29 removable intermediate transfer blanket mounted on a drum in  
30 accordance with another preferred embodiment of the  
31 invention.

1            DETAILED DESCRIPTION OF PREFERRED EMBODIMENTS

2        Reference is now made to Figs. 1 and 2 which illustrate  
3        a multicolor electrostatic imaging system constructed and  
4        operative in accordance with a preferred embodiment of the  
5        present invention. As seen in Figs. 1 and 2 there is  
6        provided an imaging sheet, preferably an organic  
7        photoreceptor 12, typically mounted on a rotating drum 10.  
8        Drum 10 is rotated about its axis by a motor or the like  
9        (not shown), in the direction of arrow 18, past charging  
10      apparatus 14, preferably a corotron, scorotron or roller  
11      charger or other suitable charging apparatus known in the  
12      art and which is adapted to charge the surface of sheet  
13      photoreceptor 12. The image to be reproduced is focused by  
14      an imager 16 upon the charged surface 12 at least partially  
15      discharging the photoconductor in the areas struck by light,  
16      thereby forming the electrostatic latent image. Thus, the  
17      latent image normally includes image areas at a first  
18      electrical potential and background areas at another  
19      electrical potential.

20       Photoreceptor sheet 12 may use any suitable  
21      arrangement of layers of materials as is known in the art,  
22      however, in the preferred embodiment of the photoreceptor  
23      sheet, certain of the layers are removed from the ends of  
24      the sheet to facilitate its mounting on drum 10.

25       This preferred photoreceptor sheet and preferred  
26      methods of mounting it on drum 10 are described in a co-  
27      pending U.S. Patent application of Belinkov et al., IMAGING  
28      APPARATUS AND PHOTORECEPTOR THEREFOR, filed September 7,  
29      1994, assigned serial number 08/301,775, and on applications  
30      filed in other countries claiming priority therefrom, the  
31      disclosure of which is incorporated herein by reference.  
32      Alternatively, photoreceptor 12 may be deposited on the drum  
33      10 and may form a continuous surface. Furthermore,  
34      photoreceptor 12 may be a non-organic type photoconductor  
35      based, for example, on a compound of Selenium.

36       Imaging apparatus 16 may be a modulated laser beam

PCNS

- 10 -

1 scanning apparatus, an optical focusing device for imaging a  
2 copy on a drum or other imaging apparatus such as is known  
3 in the art.

4 Also associated with drum 10 and photoreceptor sheet  
5 12, in the preferred embodiment of the invention, are a  
6 multicolor liquid developer spray assembly 20, a developing  
7 assembly 22, color specific cleaning blade assemblies 34, a  
8 background cleaning station 24, an electrified squeegee 26,  
9 a background discharge device 28, an intermediate transfer  
10 member 30, cleaning apparatus 32, and, optionally, a  
11 neutralizing lamp assembly 36.

12 Developing assembly 22 preferably includes a  
13 development roller 38. Development roller 38 is preferably  
14 spaced from photoreceptor 12 thereby forming a gap  
15 therebetween of typically 40 to 150 micrometers and is  
16 charged to an electrical potential intermediate that of the  
17 image and background areas of the image. Development roller  
18 38 is thus operative, when maintained at a suitable voltage,  
19 to apply an electric field to aid development of the latent  
20 electrostatic image.

21 Development roller 38 typically rotates in the same  
22 sense as drum 10 as indicated by arrow 40. This rotation  
23 provides for the surface of sheet 12 and development roller  
24 38 to have opposite velocities at the gap between them.

25 Multicolor liquid developer spray assembly 20, whose  
26 operation and structure is described in detail in U.S.  
27 Patent 5,117,263, the disclosure of which is incorporated  
28 herein by reference, may be mounted on axis 42 to allow  
29 assembly 20 to be pivoted in such a manner that a spray of  
30 liquid toner containing electrically charged pigmented toner  
31 particles can be directed either onto a portion of the  
32 development roller 38, a portion of the photoreceptor 12  
33 or directly into a development region 44 between  
34 photoreceptor 12 and development roller 38. Alternatively,  
35 assembly 20 may be fixed. Preferably, the spray is directed  
36 onto a portion of the development roller 38.

PCNS

- 11 -

1        Color specific cleaning blade assemblies 34 are  
2 operatively associated with developer roller 38 for separate  
3 removal of residual amounts of each colored toner remaining  
4 thereon after development. Each of blade assemblies 34 is  
5 selectively brought into operative association with developer  
6 roller 38 only when toner of a color corresponding thereto  
7 is supplied to development region 44 by spray assembly 20.  
8 The construction and operation of cleaning blade assemblies  
9 is described in PCT Publication WO 90/14619 and in US patent  
10 5,289,238, the disclosures of which are incorporated herein  
11 by reference.

12       Each cleaning blade assembly 34 includes a toner  
13 directing member 52 which serves to direct the toner  
14 removed by the cleaning blade assemblies 34 from the  
15 developer roller 38 to separate collection containers 54,  
16 56, 58, and 60, for each color to prevent contamination of  
17 the various developers by mixing of the colors. The toner  
18 collected by the collection containers is recycled to a  
19 corresponding toner reservoir (55, 57, 59 and 61). A final  
20 toner directing member 62 always engages the developer  
21 roller 38 and the toner collected thereat is supplied into  
22 collection container 64 and thereafter to reservoir 65 via  
23 separator 66 which is operative to separate relatively clean  
24 carrier liquid from the various colored toner particles. The  
25 separator 66 may be typically of the type described in U.S.  
26 Patent 4,985,732, the disclosure of which is incorporated  
27 herein by reference.

28       In a preferred embodiment of the invention, as  
29 described in U.S. Patent 5,255,058, the disclosure of which  
30 is incorporated herein by reference, where the imaging speed  
31 is very high, a background cleaning station 24 typically  
32 including a reverse roller 46 and a fluid spray apparatus 48  
33 is provided. Reverse roller 46 which rotates in a direction  
34 indicated by arrow 50 is electrically biased to a potential  
35 intermediate that of the image and background areas of  
36 photoconductive drum 10, but different from that of the

PCNS

- 12 -

1 development roller. Reverse roller 46 is preferably spaced  
2 apart from photoreceptor sheet 12 thereby forming a gap  
3 therebetween which is typically 40 to 150 micrometers.

4        Fluid spray apparatus 48 receives liquid toner from  
5 reservoir 65 via conduit 88 and operates to provide a supply  
6 of preferably non-pigmented carrier liquid to the gap  
7 between sheet 12 and reverse roller 46. The liquid supplied  
8 by fluid spray apparatus 48 replaces the liquid removed from  
9 drum 10 by development assembly 22 thus allowing the  
10 reverse roller 46 to remove charged pigmented toner  
11 particles by electrophoresis from the background areas of  
12 the latent image. Excess fluid is removed from reverse  
13 roller 46 by a liquid directing member 70 which continuously  
14 engages reverse roller 46 to collect excess liquid  
15 containing toner particles of various colors which is in  
16 turn supplied to reservoir 65 via a collection container 64  
17 and separator 66.

18       The apparatus embodied in reference numerals 46, 48, 50  
19 and 70 is not required for low speed systems, but is  
20 preferably included in high speed systems.

21       Preferably, an electrically biased squeegee roller 26  
22 is urged against the surface of sheet 12 and is operative to  
23 remove liquid carrier from the background regions and to  
24 compact the image and remove liquid carrier therefrom in the  
25 image regions. Squeegee roller 26 is preferably formed of  
26 resilient slightly conductive polymeric material as is well  
27 known in the art, and is preferably charged to a potential  
28 of several hundred to a few thousand volts with the same  
29 polarity as the polarity of the charge on the toner  
30 particles.

31       In a first preferred embodiment the squeegee roller is  
32 made by molding a soft polyurethane rubber coating onto a  
33 metal core, coating the molded core with a conductive  
34 lacquer and coating the lacquer with a low conductivity  
35 elastomer. Alternatively, in a second embodiment, the molded  
36 coating can be made of an elastomer with a controlled

PCNS

- 13 -

1 conductivity and the lacquer can be omitted. In a third  
2 embodiment, a single coating of controlled conductivity  
3 elastomer is used and the outer layer is omitted.

4 In the first squeegee embodiment the metal core is  
5 cleaned, and coated with a rubber to metal adhesive, such  
6 as, for example CILBOND 49 SF (Compounding Ingredients  
7 Limited, UK) dissolved in an equal amount of methyl ethyl  
8 ketone, which is dried at 110°C for one hour. An outer mold  
9 having a diameter about 9.5 mm greater than that of the core  
10 is dip coated with a release agent, such as, for example, a  
11 mixture of 10 parts Syl-Off 7600 (Dow Corning), 1 part Syl-  
12 Off 7601 and 150 parts n-hexane which is then cured for one  
13 hour at 110°C. The space between the core and the mold (pre-  
14 heated to 70-80°C) is filled with polyurethane rubber for  
15 casting (CIL A 20, Compounding Ingredients Limited, UK)  
16 which is preheated under vacuum at 80°C for 16 hours and  
17 then at 120°C for an additional hour. The polyurethane is  
18 cured at 135°C for 8 hours. After cooling and removal of the  
19 coated core from the mold (which removal may be aided by a  
20 solvent, such as Isopar), the cast material is ground to  
21 size to approximately ±5 micrometers. The preferred hardness  
22 of the coating is about 20 Shore A, although this hardness  
23 may vary from 15-40 Shore A depending on the amount of  
24 liquid removal desired.

25 The ground surface is cleaned with acetone and  
26 preferably dip coated with a conductive lacquer (preferably,  
27 3 parts H322 (Lord Corporation, USA) and 1 part ethyl  
28 acetate) which has been prefiltered through a lint free  
29 cloth to give a thickness (after drying) of about 30  
30 micrometers.

31 A top layer of 50 parts Fomrez 50 (Witco. Corp., USA)  
32 dissolved in 75 parts ethyl acetate to which is added 3  
33 parts of DC193 (Dow Corning) and about 6 parts of di-phenyl  
34 methane 4,4' di-isocyanate (MDI) (Desmodor 44V20  
35 manufactured by Bayer, Germany) is filtered and dip coated  
36 onto the lacquer coating a plurality of times to achieve a

PCNS

- 14 -

1 coating thickness of 60-70 micrometers. The coated squeegee  
2 is dried at room temperature and cured at 140°C for 2 hours.  
3 The preferred hardness of the material forming the outer  
4 layer is about 30-35 Shore A and this hardness can be  
5 controlled by changing the proportion of MDI in the coating.  
6 The coating has a resistivity in the range of  $10^8$  to  $10^{10}$   
7 ohm-cm, with a preferred value of  $1-3 \times 10^8$  to  $2-3 \times 10^9$  ohm-cm.

8 In the second embodiment of the squeegee roller, the  
9 cast covering for the core is preferably an elastomer having  
10 the proper combination of hardness (15-30 Shore A,  
11 preferably 20 Shore A) and resistivity ( $1-10 \times 10^6$  ohm-cm).  
12 This material can be polyurethane, nitrile or other oil  
13 resistant rubber. Polyurethane with selectable resistivity  
14 and hardness is available from Merthane Products (USA).  
15 After casting as described above, the coating is ground to  
16 size and finish and coated with a top layer which is made in  
17 the same manner as the top layer of the first embodiment.

18 In the third embodiment of the squeegee roller, the top  
19 layer is omitted and the conductive elastomer is preferably  
20 cast to exact size.

21 Discharge device 28 is operative to flood the sheet 12  
22 with light which discharges the voltage remaining on sheet  
23 12, mainly to reduce electrical breakdown and improve  
24 transfer of the image to intermediate transfer member 30.  
25 Operation of such a device in a write black system is  
26 described in U.S. Patent 5,280,326, the disclosure of which  
27 is incorporated herein by reference.

28 Figs. 1 and 2 further show that multicolor toner spray  
29 assembly 20 receives separate supplies of colored toner  
30 typically from four different reservoirs 55, 57, 59 and 61.  
31 Figure 1 shows four different colored toner reservoirs 55,  
32 57, 59 and 61 typically containing the colors Yellow,  
33 Magenta, Cyan and, optionally, Black respectively. Pumps 90,  
34 92, 94 and 96 may be provided along respective supply  
35 conduits 98, 101, 103 and 105 for providing a desired amount  
36 of pressure to feed the colored toner to multicolor spray

PCNS

- 15 -

1 assembly 20. Alternatively, multicolor toner spray assembly  
2 20, which is preferably a three level spray assembly,  
3 receives supplies of colored toner from up to six different  
4 reservoirs (not shown) which allows for custom colored toner  
5 in addition to the standard process colors.

6 A preferred type of toner for use with the present  
7 invention is that described in Example 1 of U.S. Patent  
8 4,794,651, the disclosure of which is incorporated herein by  
9 reference or variants thereof as are well known in the art.  
10 For colored liquid developers, carbon black is replaced by  
11 color pigments as is well known in the art. Other toners may  
12 alternatively be employed, including liquid toners and, as  
13 indicated above, including powder toners.

14 Another preferred embodiment of the toner for use in  
15 the invention is prepared using the following method:

16 1) Solubilizing 1400 grams of Nucrel 925 (ethylene  
17 copolymer by Dupont) and 1400 g of Isopar L (Exxon) are  
18 thoroughly mixed in an oil heated Ross Double Planetary  
19 Mixer at least 24 RPM for 1.5 hours, with the oil  
20 temperature at 130°C. 1200 g of preheated Isopar L is added  
21 and mixing is continued for an additional hour. The mixture  
22 is cooled to 45°C, while stirring is continued over a period  
23 of several hours, to form a viscous material.

24 2) Milling and Grinding 762 grams of the result of the  
25 Solubilizing step are ground in a 1S attritor (Union Process  
26 Inc. Akron Ohio), charged with 3/16" carbon steel balls at  
27 250 RPM, together with 66.7 grams of Mogul L carbon black  
28 (Cabot), 6.7 grams of BT 583D (blue pigment produced by  
29 Cookson), 5 grams of aluminum tri stearate and an additional  
30 1459.6 grams of Isopar L for eight hours at 30°C.

31 3) Continuation of Grinding 34.5 grams of ACumist A-12  
32 (a micronised polyethylene wax produced by Allied Signal) is  
33 added and grinding is continued for an additional 4 hours.  
34 The resulting particles are fibrous particles have a  
35 measured diameter in the range of 1-3 micrometers.

36 The resulting material is diluted with additional

PCNS

- 16 -

1 Isopar L and Marcol 82 to give a working developer in which  
2 the dry solids portion is about 1.7% and in which the  
3 overall ratio of Isopar L to Marcol is between about 50:1  
4 and 500:1, more preferably between about 100:1 and 200:1.  
5 Charge director as described in US patent application  
6 07/915,291 (utilizing lecithin, BBP and ICIG3300B) and in WO  
7 94/02887, in an amount equal to 40 mg/gm of solids, is added  
8 to charge the toner particles. Other charge directors and  
9 additional additives as are known in the art may also be  
10 used.

11 The above described process produces a black toner.  
12 Cyan, magenta and yellow toners can be produced by using a  
13 different mix of materials for step 2). For Cyan toner, 822g  
14 of the solubilized material, 21.33 grams each of BT 583D and  
15 BT 788D pigments (Cookson), 1.73 grams of D1355DD pigment  
16 (BASF), 7.59 grams of aluminum tri stearate and 1426 grams  
17 of Isopar L are used in step 2. For Magenta toner, 810 grams  
18 of solubilized material, 48.3 grams of Finess Red F2B, 6.81  
19 grams of aluminum tri-stearate and 1434.2 grams of Isopar L  
20 are used in step 2. For yellow toner 810 grams of  
21 solubilized material, 49.1 grams of D1355DD pigment, 6.9  
22 grams of aluminum tri-stearate and 1423 grams of Isopar L  
23 are used in step 2.

24 Intermediate transfer member 30, an especially  
25 preferred embodiment of which is described in detail below  
26 (in conjunction with Figs. 3 and 4), may, for some  
27 embodiments of the invention, be any suitable intermediate  
28 transfer member having a multilayered transfer portion such  
29 as those described below or in US Patents 5,089,856 or  
30 5,047,808 or in the applications of which this application  
31 is a continuation in part, the disclosures of which are  
32 incorporated herein by reference and by other structures  
33 known in the art. Member 30 is maintained at a suitable  
34 voltage and temperature for electrostatic transfer of the  
35 image thereto from the image bearing surface. Intermediate  
36 transfer member 30 is preferably associated with a pressure

PCNS

- 17 -

1 roller 71 for transfer of the image onto a final substrate  
2 72, such as paper, preferably by heat and pressure. For the  
3 especially preferred toner described above, an image  
4 temperature of about 95°C at the inception of fusing is  
5 preferred.

6 Certain aspects of the present invention, especially  
7 the method of mounting a transfer blanket on a drum are of  
8 general applicability and are applicable to a wide range of  
9 blanket types for ink, liquid toner or powder toner as are  
10 known in the art.

11 Cleaning apparatus 32 is operative to scrub clean the  
12 surface of photoreceptor 12 and preferably includes a  
13 cleaning roller 74, a sprayer 76 to spray a non-polar  
14 cleaning liquid to assist in the scrubbing process and a  
15 wiper blade 78 to complete the cleaning of the  
16 photoconductive surface. Cleaning roller 74 which may be  
17 formed of any synthetic resin known in the art for this  
18 purpose is driven in the same sense as drum 10 as indicated  
19 by arrow 80, such that the surface of the roller scrubs the  
20 surface of the photoreceptor. Any residual charge left on  
21 the surface of photoreceptor sheet 12 may be removed by  
22 flooding the photoconductive surface with light from  
23 optional neutralizing lamp assembly 36, which may not be  
24 required in practice.

25 In accordance with a preferred embodiment of the  
26 invention, after developing each image in a given color, the  
27 single color image is transferred to intermediate transfer  
28 member 30. Subsequent images in different colors are  
29 sequentially transferred in alignment with the previous  
30 image onto intermediate transfer member 30. When all of the  
31 desired images have been transferred thereto, the complete  
32 multi-color image is transferred from transfer member 30 to  
33 substrate 72. Impression roller 71 only produces operative  
34 engagement between intermediate transfer member 30 and  
35 substrate 72 when transfer of the composite image to  
36 substrate 72 takes place. Alternatively, each single color

1 image is separately transferred to the substrate via the  
2 intermediate transfer member. In this case, the substrate is  
3 fed through the machine once for each color or is held on a  
4 platen and contacted with intermediate transfer member 30  
5 for composite image transfer. Alternatively, the  
6 intermediate transfer member is omitted and the developed  
7 single color images are transferred sequentially directly  
8 from drum 10 to substrate 72.

9 Figs. 3A, 3B and 4A-4D illustrate a preferred  
10 embodiment of intermediate transfer member 30 in accordance  
11 with a preferred embodiment of the invention. Fig 3A shows  
12 an intermediate transfer blanket 100 mounted on a drum 102.  
13 Transfer blanket 100 (whose details are shown in Figs. 4C  
14 and 4D) comprises a preferably layered transfer portion 104  
15 and a mounting fitting 106.

16 As shown most clearly in Fig. 4C, transfer portion 104  
17 comprises a release layer 109 which is outermost on the  
18 blanket when it is mounted on drum 102. Underlying layer 109  
19 is a conforming layer 111 preferably of a soft elastomer,  
20 preferably of polyurethane and preferably having a Shore A  
21 hardness of less than about 65, more preferably, less than  
22 about 55, but preferably more than about 35. A suitable  
23 hardness value is between 45-55, preferably about 50.  
24 Underlying layer 111 is a conductive layer 114 which  
25 overlays a thin barrier layer 115. Barrier layer 115  
26 overlays a blanket body 116 comprising a top layer 118, a  
27 compressible layer 120 and a fabric layer 122. Underlying  
28 the fabric layer is preferably an adhesive layer 126 which  
29 is in contact with drum 102.

30 Drum 102 is preferably heated by an internal halogen  
31 lamp heater or other heater to aid transfer of the image to  
32 and from the release layer 109 to a final substrate as is  
33 well known in the art. Other heating methods, or no heating  
34 at all, may also be used in the practice of some aspects of  
35 the invention. The degree of heating will depend on the  
36 characteristics of the toner and or ink used in conjunction

1 with the invention.

2 As shown in Figs. 4A, 4B and 4D, mounting fitting 106  
3 comprises an elongate electrically conducting bar 108, for  
4 example of a metal such as aluminum formed with a series of  
5 L-shaped mounting legs 110 (in the form of finger-like  
6 extensions) which are also conducting, preferably of the  
7 same material as bar 108, and preferably formed integrally  
8 therewith. In particular, bar 108 is formed with a slot into  
9 which the end of layered transfer portion 104 is inserted.  
10 Preferably, the end of the layered portion which is inserted  
11 into the mounting bar does not have a release layer 109 or  
12 conforming layer 111, whereby conducting layer 114 is  
13 exposed and is therefore in electrical contact with bar 108.  
14 Alternatively, the bar 108 can be formed with sharp internal  
15 projections which pierce the outer layers of the blanket and  
16 contact the conducting layer.

17 Optionally, each of the layers beneath the conducting  
18 layer 114 may be partially conducting (for example, by the  
19 addition of conductive carbon black or metal fibers) and the  
20 adhesive layer may be conductive, such that current also  
21 flows directly from the drum surface to the conducting  
22 layer.

23 In one preferred embodiment of the invention, fitting  
24 106 is formed of a single sheet of metal, wherein the legs  
25 are partially cut from the metal which is bent into a U  
26 shape to form the slot into which the layered portion is  
27 inserted. After insertion, the outer walls of the slot are  
28 forced against the layered portion to secure the layered  
29 portion in the slot. The partially cut out portion is bent  
30 to form the mounting legs.

31 In the preferred embodiment of the invention shown in  
32 Figs. 1-3, drum 102 is maintained at a potential suitable  
33 for transferring images to the intermediate transfer member,  
34 for example at 500 volts, which voltage is applied, via  
35 mounting fitting 106 to conductive layer 114. Thus, the  
36 source of transfer voltage is very near the outer surface of

1 portion 104 which allows for a lower transfer potential on  
2 the drum.

3 In a preferred embodiment of the invention, Transfer  
4 portion 104 is fabricated by the following procedure:

5 1- The starting structure for blanket construction is a  
6 blanket body 116 generally similar to that generally used  
7 for printing blankets. One suitable body is MCC-1129-02  
8 manufactured and sold by Reeves SpA, Lodi Vecchio (Milano),  
9 Italy. Other preferred blanket types are described in US  
10 Patents 5,047,808; 4,984,025; 5,335,054 and PCT publications  
11 WO 91/03007; WO 91/14393; WO 90/14619; and WO 90/04216,  
12 which are incorporated herein by reference. In a preferred  
13 embodiment of the invention, body 116 comprises a fabric  
14 layer 122, preferably of woven NOMEX material and having a  
15 thickness of about 200 micrometers, a compressible layer  
16 120, preferably comprising about 400 micrometers of  
17 saturated nitrile rubber loaded with carbon black to  
18 increase its thermal conductivity. Layer 120 preferably  
19 contains small voids (about 40 - 60 % by volume) and a top  
20 layer 118 preferably comprised of the same material as the  
21 compressible layer, but without voids. Layer 109 is  
22 preferably about 100 micrometers thick. The blanket body is  
23 produced by manufacturing methods as are generally used for  
24 the production of offset printing blankets for ink offset  
25 printing.

26 Blanket body 116 is preferably sized to a relatively  
27 exact thickness by abrading portions of the surface of top  
28 layer 118. A preferred thickness for the finished body 116  
29 is about 700 micrometers, although other thicknesses are  
30 useful, depending on the geometry of the printing system in  
31 which it is used and the exact materials used in the blanket  
32 body.

33 2- The fabric side of blanket body 116 is preferably  
34 coated with a 30 micrometer thick coating of silicone based  
35 adhesive (preferably, Type D 66 manufactured by Dow  
36 Corning). The adhesive is covered with a sheet of mylar

PCNS

- 21 -

1 coated with a fluorosilicone material, such as DP 5648  
2 Release Paper (one side coat) distributed by H.P. Smith  
3 Inc., Bedford Park, IL. This adhesive is characterized by  
4 its good bond to the surface of drum 102 and is resistant to  
5 the carrier liquid used in the liquid toner. The blanket may  
6 be removed from the drum, when its replacement is desired,  
7 by cutting the blanket along the edge of fitting 106 and  
8 removing the blanket and fitting.

9 An adhesive is used to assure good thermal contact  
10 between the back of the blanket and the drum on which it is  
11 mounted. A silicone adhesive is used since adhesives  
12 normally used in attachment of blankets deteriorate under  
13 the heat which is generated in the underlying drum in the  
14 preferred apparatus. While the temperature of the drum  
15 varies, depending on the thermal resistance of the blanket  
16 and the desired surface temperature of the blanket (which in  
17 turn depends on the toner used in the process and the  
18 details of transfer of the toner to the final substrate),  
19 the drum temperature may reach 80°C, 100°C, 120°C or 150°C  
20 or more.

21 3- Top layer 118 is preferably coated with a sub-micron  
22 layer of primer before being coated with additional layers.  
23 A preferred primer is Dow Corning 1205 Prime Coat. The type  
24 of primer depends on the properties of the top layer and of  
25 the conductive layer. Preferably, 0.3 micron of primer is  
26 coated onto a clean top layer with a No. 0 bar in a wire-rod  
27 coating apparatus and is allowed to dry before applying the  
28 conductive layer.

29 4- Since blanket body 116 may contain materials such as  
30 anti-oxidants, anti-ozonants or other additives which may  
31 migrate through the upper layers of the blanket, for example  
32 as a gas when the blanket is heated during the imaging  
33 process and/or in the presence of carrier liquid such as  
34 Isopar L, barrier layer 115 is preferably coated onto top  
35 layer 118 (or more exactly onto the primer). This barrier  
36 layer should be substantially impervious to such materials

PCNS

- 22 -

1 in the blanket body which may migrate and/or to the carrier  
2 liquid which is used.

3 If this layer is omitted, under certain circumstances  
4 the additive materials can cause deterioration of the  
5 photoreceptor. In particular, it was found that the imaging  
6 process may become humidity dependent.

7 In a preferred embodiment of the invention, a 4-11  
8 micrometer layer of polyvinyl alcohol (88% hydrolyzed) is  
9 coated onto the primer layer covering top layer 118.

10 Polyvinyl alcohol, 88% hydrolyzed, having an average  
11 molecular weight preferably between 85,000 and 145,000  
12 (Aldrich Chemical Co. Inc., Milwaukee, WI) is dissolved in  
13 water at 90°C by continuously stirring the mixture in a  
14 reflux system for 30 minutes. After 30 minutes, a quantity  
15 of ethanol equal to twice the quantity of water is added to  
16 the solution, the resulting polyvinyl alcohol concentration  
17 being preferably less than 10%. Higher concentration  
18 solutions can be used; however, they give a more viscous  
19 solution which is hard to spread evenly.

20 The solution is deposited on layer 118 of body 116  
21 using a fine wire rod or knife inclined at 30-45° to the  
22 direction of movement of the knife or body. The solvent is  
23 evaporated either by drying at room temperature or by  
24 blowing hot air on the layer.

25 One or more coating passes are employed to give the  
26 required thickness.

27 Too thin a layer will result in some transfer of  
28 material from body 116, which has been correlated with  
29 reduced transfer efficiency from the photoreceptor to the  
30 intermediate transfer blanket, which is believed to be  
31 caused by photoreceptor deterioration. While four  
32 micrometers of material appears to be sufficient to avoid  
33 leaching, a somewhat larger thickness is preferably used.

34 Other barrier materials and other thicknesses may be  
35 used depending on the carrier liquid used for the toner or  
36 the gasses omitted by body 116. Other barrier materials may

PCNS

- 23 -

1 require lesser or greater thickness depending on their  
2 resistance to the carrier liquid or the gasses released by  
3 body 116. Alternatively, if body 116 resists leaching by the  
4 carrier liquid or does not contain materials which are  
5 released (especially when body 116 is heated) or any anti-  
6 oxidants and/or anti-ozonants, layer 115 may be omitted.

7 Polyvinyl alcohol is a thermoplastic crystalline  
8 material having a melting point which is higher than the  
9 temperature of the blanket during operation. Polyvinyl  
10 alcohol is also believed to form a layer which is impervious  
11 to gasses and to the hydrocarbon carrier liquid used in the  
12 liquid toner.

13 5- Conductive layer 114 is preferably formed of acrylic  
14 rubber loaded with conductive carbon black. In a preferred  
15 embodiment of the invention, only 2-3 micrometers of  
16 conductive coating are required. The conductive layer is  
17 formed by first compounding 300 grams of Hytemp 4051EP (Zeon  
18 Chemicals) with 6 grams of Hytemp NPC 50 and 9 grams of  
19 sodium stearate in a two-roll mill for 20 minutes; and then  
20 dissolving 150 grams of the compounded material in 2000  
21 grams of methyl ethyl ketone (MEK) by stirring for 12 hours  
22 at room temperature.

23 40 grams of conductive carbon black, such as, for  
24 example, Printex XE2 (Degussa) are added to the solution and  
25 the mixture is ground in a 01 attritor (Union Process)  
26 loaded with 3/16" steel balls. Grinding proceeds at 10°C for  
27 4 hours after which time the material is diluted by the  
28 addition of MEK to a concentration of 7.5-8% solids and  
29 discharged from the grinder in the form of a conductive  
30 lacquer.

31 The blanket (after step 3 or step 4) is overcoated with  
32 about 3 micrometers of the conductive lacquer (three passes  
33 using a No. 0 rod) and allowed to dry for 5 minutes at room  
34 temperature.

35 An additional coating of primer is added over the  
36 conductive lacquer (except for the portion which is to be

PCNS

- 24 -

1 inserted into bar 108) before the soft elastomeric  
2 conforming layer is applied.

3 The resistance of the conductive layer should  
4 preferably be more than about 20 kohms/square and preferably  
5 less than about 50 kohm/square. This value will depend on  
6 the resistivity of the layers above the conducting layer and  
7 on the aspect ratio of the blanket. In general, the  
8 resistance should be low enough so that the current flowing  
9 on the conducting layer (to supply leakage current through  
10 the overlying layers) should not cause a substantial  
11 variation of voltage along the surface of the blanket. The  
12 resistance of the conducting layer and, more importantly,  
13 the resistance of the overlying layers control the current  
14 flowing through the overlying layers. Generally speaking,  
15 the conductive layer has a relatively low resistance and  
16 resistivity, the conforming layer (layer 111) has a higher  
17 resistivity and the overlying release layer (layer 109) has  
18 a still higher resistivity.

19 6- One kg of pre-filtered Fomrez-50 polyester resin  
20 (Hagalil Company, Ashdod, Israel) is dehydrated and degassed  
21 under vacuum at 60°C. 600 grams of the degassed material is  
22 mixed with 1.4 grams of di-butyl-tin-diluarate (Aldrich) and  
23 degassed at room temperature for 2 hours. 30 grams of the  
24 resulting material, 3.15 grams of RTV Silicone 118 (General  
25 Electric) and 4.5 grams of Polyurethane cross-linker,  
26 DESMODUR 44V20 (Bayer) are stirred together. A 100  
27 micrometer layer of the material is coated over the primed  
28 conductive layer using a No. 3 wire rod with several passes  
29 under clean conditions, preferably, class 100 conditions.  
30 The coating is cured for two hours at room temperature under  
31 a clean hood to form a polyurethane layer.

32 Other methods of forming suitable conforming layers are  
33 shown and described in the parents of this application.  
34 Alternatively, the conductive layer may be omitted and layer  
35 118 made conductive.

36 Layer 111 which is thus formed should have a resistance

PCNS

- 25 -

1 of the order of about  $10^9$  ohm-cm, good thermal stability at  
2 the working temperature of the blanket surface, which is  
3 preferably about 100°C or less.

4 The function of the conforming layer is to provide good  
5 conformation of the blanket to the image forming surface  
6 (and the image on the image forming surface) at the low  
7 pressures used in transfer of the image from the image  
8 forming surface to the blanket. The layer should have a  
9 Shore A hardness preferably of between 25 or 30 and 65, more  
10 preferably about 50. While a thickness of 100 micrometers is  
11 preferred, other thicknesses, between 50 micrometers and 300  
12 micrometers can be used, with 75 to 125 micrometers being  
13 preferred.

14 7- 12 grams of RTV silicone 236 (Dow Corning) release  
15 material preferably diluted with 2 grams of Isopar L (Exxon)  
16 and 0.72 grams of Syl-off 297 (Dow Corning) are mixed  
17 together. A wire rod (bar No. 1) coating system is used,  
18 with five or six passes, under clean conditions to achieve  
19 an 8 micrometer release layer thickness. The material is  
20 cured at 140°C for two hours. The cured release material has  
21 a resistivity of approximately  $10^{14}$  to  $10^{15}$  ohm-cm.

22 In order to mount blanket 100 on drum 102, mounting  
23 legs 110 are inserted into a plurality of mounting holes 130  
24 formed in drum 102, preferably without removing the mylar  
25 sheet from the adhesive layer (the back of the blanket). As  
26 can be seen most clearly in Fig. 3A, 3B and 4D, mounting  
27 legs 110 each have a tip portion 132 and a back portion 134.  
28 Tips 132 are inserted into slots formed in the far sidewalls  
29 of mounting holes 130 and the back portion 134 rests against  
30 the opposite sidewall of the hole. In this way the end of  
31 the blanket is accurately positioned. The edge of the mylar  
32 sheet closest to the legs is removed and the remainder of  
33 the mylar sheet is progressively removed while making sure  
34 that the successive portions of the blanket which are thus  
35 attached to the drum by the adhesive lie flat against the  
36 drum.

PCNS

- 26 -

1        The present inventors have found that this method of  
2 mounting is far superior to either adhesive mounting alone  
3 or to grippers at both ends of the blanket in providing a  
4 stable transfer surface.

5        As an alternative to, or additional to, the adhesive  
6 layer 126, a very soft conforming layer may be used at the  
7 back of the blanket. A soft layer of this type will allow  
8 for good thermal contact between the blanket and the heated  
9 drum 102 so that the temperature of the drum need not be  
10 excessive in order for the outer surface of the blanket to  
11 reach its operating temperature. Furthermore, such a very  
12 soft layer will cause the blanket to "cling" to the drum  
13 obviating the use of adhesive under certain circumstances.  
14 Furthermore, when the blanket is replaced there is no  
15 adhesive residue on the drum to be removed.

16       A very soft layer may be produced by the following  
17 method:

18       1- 100g of Hi-Temp 4051 EP (Zeon) acrylic resin is  
19 mixed with 2g NPC-50 crosslinker (Zeon) and 3g sodium  
20 stearate and dissolved in toluene to give a solution of 15%  
21 non-volatile solids. Optionally, up to about 40g of carbon  
22 black Pearls 130 (Cabot) is added.

23       2- A thin layer of the solution is coated onto release  
24 coated mylar and dried. This process is repeated several  
25 times until a thickness of preferably 20-30 micrometers is  
26 achieved.

27       3- The uncured resin is laminated to the adhesive  
28 layer of a blanket produced in accordance with the  
29 invention, or directly to the fabric layer. This step is  
30 preferably carried out prior to the cure of the release  
31 layer.

32       4- The laminated structure is cured together with the  
33 release layer and the release coated mylar is removed.

34       The layer has a Shore A hardness of about 20-24  
35 without carbon black and about 40-45 with carbon black.  
36 Softer materials are also suitable; however, substantially

PCNS

- 27 -

1 harder materials do not adhere well to the drum surface.  
2 Optionally, the adhesive layer at the trailing end of the  
3 blanket is not coated with the very soft layer to improve  
4 coherence of the blanket and the drum. This is especially  
5 desirable for harder layers.

6 The acrylic material may be replaced by other soft  
7 elastomer materials such as soft polyurethane or nitrile  
8 rubber. Other heat improving fillers which have a smaller  
9 effect on the hardness of the final product may be used  
10 instead of carbon black, such as  $Fe_2O_3$  or alpha aluminum  
11 oxide.

12 Fig. 5 shows an alternative, preferred embodiment of  
13 the invention in which somewhat different shaped holes 130' are used. In this embodiment the back portion 134 rests  
15 against a protrusion 150 formed on one side of the hole  
16 while a surface 154 of leg 110 rests against the bottom 156  
17 of a protrusion formed on the other side of the hole.

18 While the preferred electrical connection between the  
19 conductive layer and the mounting bar is preferably achieved  
20 by removing (or not forming) the layers which overlay an end  
21 portion of the conductive layer, piercing the overlying  
22 layers, for example, by crimping and/or piercing the  
23 mounting bar, for example, at points marked 160 in Fig. 4D.  
24 Crimping can also be used to hold the blanket in the  
25 mounting bar.

26 While the adhesive layer preferably covers the back of  
27 the blanket, alternatively the adhesive layer may cover only  
28 a portion of the back such as the edge farthest away from  
29 the bracket (the trailing edge of the blanket); or may, for  
30 some embodiments of the invention and under certain  
31 circumstances, be omitted.

32 It should be understood that some aspects of the  
33 invention are not limited to the specific type of image  
34 forming system used and some aspects of the present  
35 invention are also useful with any suitable imaging system  
36 which forms a liquid toner image on an image forming surface

PCNS

- 28 -

1 and, for some aspects of the invention, with powder toner  
2 systems. Some aspects of the invention are also useful in  
3 systems such as those using other types of intermediate  
4 transfer members such as belt or continuous coated drum type  
5 transfer members. Some aspects of the invention are suitable  
6 for use with offset printing systems. The specific details  
7 given above for the image forming system are included as  
8 part of a best mode of carrying out the invention; however,  
9 many aspects of the invention are applicable to a wide range  
10 of systems as known in the art for electrophotographic and  
11 offset printing and copying.

12 It will be appreciated by persons skilled in the art  
13 that the present invention is not limited by the description  
14 and example provided hereinabove. Rather, the scope of this  
15 invention is defined only by the claims which follow:

CLAIMS

2 1. Imaging apparatus comprising:

3 an imaging surface having a toner image formed thereon;  
4 and5 an intermediate transfer member, which receives the  
6 toner image from the imaging surface and from which it is  
7 subsequently transferred, comprising:8 a drum having mounting recesses formed therein; and  
9 an intermediate transfer blanket mounted on the  
10 drum, the blanket comprising:11 a layered transfer portion having a transfer  
12 surface on one face thereof which receives the toner image;  
13 and14 a mounting fixture, attached to only one edge of  
15 the layered transfer portion and adapted to mate with the  
16 mounting recesses in the drum,17 whereby the transfer blanket is removably mounted on  
18 the drum.

19

20 2. Apparatus according to claim 1 wherein at least a  
21 portion of a surface of the layered transfer portion  
22 opposite to the transfer surface is bonded to the drum.

23

24 3. Apparatus according to claim 1 or claim 2 wherein the  
25 layered transfer portion comprises an adhesive layer on a  
26 second face thereof opposite the transfer surface.

27

28 4. Apparatus according to any of the preceding claims  
29 wherein the layered transfer portion comprises an  
30 electrically conductive layer underlying the transfer  
31 surface; and32 wherein the mounting fixture comprises an electrically  
33 conductive element, attached to one edge of the transfer  
34 portion, which is electrically connected to the electrically  
35 conductive layer.

36

PCNS

- 30 -

1 5. Apparatus according to claim 4 wherein the electrically  
2 conductive element contacts the drum and wherein the drum is  
3 electrified to a voltage which is operative to transfer the  
4 toner image from the imaging surface to the transfer  
5 surface.

6

7 6. Apparatus according to claim 4 wherein the electrically  
8 conductive element comprises at least one "L" shaped finger-  
9 like extension extending therefrom.

10

11 7. Apparatus according to claim 6 wherein said at least  
12 one "L" shaped extension has a first portion extending in a  
13 direction perpendicular to the layered transfer portion and  
14 a second portion attached and substantially perpendicular  
15 to the first portion and extending substantially parallel to  
16 and away from the layered transfer portion.

17

18 8. Apparatus according to claim 7 wherein said mounting  
19 recesses further comprise recesses therein which receive  
20 said second portion.

21

22 9. A substantially rectangular intermediate transfer  
23 blanket comprising:

24 a layered transfer portion having a transfer surface on  
25 one face thereof; and

26 a mounting fixture, adapted for mounting the blanket on  
27 a drum, attached to only one edge of the layered transfer  
28 portion.

29

30 10. An intermediate transfer blanket according to claim 9  
31 wherein the layered transfer portion comprises an  
32 electrically conductive layer underlying the transfer  
33 surface; and

34 wherein the mounting fixture comprises an electrically  
35 conductive element, attached to one edge of the transfer  
36 portion, which is electrically connected to the electrically

PCNS

- 31 -

1 conductive layer.

2

3 11. A substantially rectangular intermediate transfer  
4 blanket comprising:

5       a layered transfer portion having a transfer surface on  
6 one face and including an electrically conductive layer  
7 underlying the transfer surface; and  
8       an electrically conductive element, attached to one  
9 edge of the transfer portion, which is electrically  
10 connected to the conducting layer.

11

12 12. An intermediate transfer blanket according to claim 10  
13 or claim 11 wherein the conductive element comprises at  
14 least one "L" shaped finger-like extension extending  
15 therefrom.

16

17 13. An intermediate transfer blanket according to claim 12  
18 wherein said at least one "L" shaped extension has a first  
19 portion extending in a direction perpendicular to the  
20 layered transfer portion and a second portion attached and  
21 substantially perpendicular to the first portion extending  
22 away from the layered transfer portion.

23

24 14. An intermediate transfer blanket according to any of  
25 claims 9-13 wherein the layered transfer portion comprises a  
26 conformal layer formed of a material having a Shore A  
27 hardness of less than 65.

28

29 15. A layered intermediate transfer member comprising:  
30       an outermost transfer surface; and  
31       a conforming layer operatively associated with the  
32 transfer surface and having a shore A hardness of less than  
33 about 65.

34

35 16. A substantially rectangular intermediate transfer  
36 member according to claim 15.

PCNS

- 32 -

1

2 17. An intermediate transfer member according to any of  
3 claims 14-16 wherein said conforming layer has a Shore A  
4 hardness of less than about 50.

5

6 18. An intermediate transfer member according to any of  
7 claims 14-17 wherein said conforming layer has a Shore A  
8 hardness of more than about 30.

9

10 19. An intermediate transfer member according to claim 18  
11 wherein said conforming layer has a Shore A hardness of more  
12 than about 35.

13

14 20. An intermediate transfer blanket according to any of  
15 claims 9-19 wherein the layered transfer portion comprises a  
16 soft layer, having a Shore A hardness of less than 90, on  
17 the surface of the layered transfer portion opposite to the  
18 transfer surface.

19

20 21. A layered intermediate transfer blanket comprising:  
21 an transfer surface on one face of the blanket; and  
22 a soft layer on the opposite face of the blanket which  
23 has a Shore A hardness of less than 90.

24

25 22. An intermediate transfer member according to claim 20  
26 or claim 21 wherein the soft layer has a Shore A hardness of  
27 less than about 45.

28

29 23. An intermediate transfer member according to claim 20  
30 or claim 23 wherein the soft layer has a Shore A hardness of  
31 less than about 25.

32

33 24. An intermediate transfer member according to claim 20  
34 or claim 23 wherein the soft layer has a Shore A hardness of  
35 about 45.

36

PCNS

- 33 -

1 25. An intermediate transfer blanket according to any of  
2 claims 20-24 wherein the soft layer comprises an acrylic  
3 elastomer.

4

5 26. An intermediate transfer member according to any of  
6 claims 9-19 and including:

7 an adhesive layer on the opposite face of the blanket  
8 from the transfer surface.

9

10 27. An intermediate transfer member according to claim 26  
11 wherein the adhesive layer is stable at a temperature of at  
12 least 80°C.

13

14 28. A layered intermediate transfer blanket comprising:  
15 an transfer surface on one face of the blanket; and  
16 an adhesive layer on the opposite face of the blanket  
17 which is stable at a temperature of at least 80°C.

18

19 29. An intermediate transfer blanket according to any of  
20 claims 26-28 wherein the adhesive layer is stable at a  
21 temperature above 100°C.

22

23 30. An intermediate transfer blanket according to claim 29  
24 wherein the adhesive layer is stable at a temperature above  
25 120°C.

26

27 31. An intermediate transfer blanket according to claim 29  
28 wherein the adhesive layer is stable at a temperature above  
29 150°C.

30

31 32. An intermediate transfer member according to any of  
32 claims 9-31 and including:

33 a resilient layer underlying the transfer surface; and  
34 a barrier layer that is substantially impervious to  
35 liquid hydrocarbons and is situated intermediate the  
36 resilient layer and the transfer surface.

1  
2 33. A layered intermediate transfer member, comprising:  
3 a transfer surface;  
4 a resilient layer underlying the transfer surface; and  
5 a barrier layer that is substantially impervious to  
6 liquid hydrocarbons and is situated intermediate the  
7 resilient layer and the transfer surface.

8  
9 34. An intermediate transfer member according to claim 32  
10 or claim 33 wherein the resilient layer comprises a material  
11 which is at least partly leachable by the liquid  
12 hydrocarbon.

13  
14 35. An intermediate transfer member according to any of  
15 claims 32-34 wherein the member is adapted for the transfer  
16 of liquid toner images comprising toner particles and  
17 carrier liquid and wherein the liquid hydrocarbon is said  
18 carrier liquid.

19  
20 36. An intermediate transfer member according to any of  
21 claims 9-31 and including:  
22 a resilient layer underlying the transfer surface; and  
23 a barrier layer that is substantially impervious to  
24 gases and is situated intermediate the resilient layer and  
25 the transfer surface.

26  
27 37. A layered intermediate transfer member, comprising:  
28 a transfer surface;  
29 a resilient layer underlying the transfer surface which  
30 releases gases; and  
31 a barrier layer that is substantially impervious to the  
32 gasses and is situated intermediate the resilient layer and  
33 the transfer surface.

34  
35 38. An transfer member according to any of claims 31-37  
36 wherein the barrier layer comprises at least partially

PCNS

- 35 -

1 hydrolyzed polyvinyl alcohol.

2

3 39. An intermediate transfer member comprising:

4 a conductive layer having a relatively low electrical  
5 resistivity;

6 an outer layer having a relatively high electrical  
7 resistivity; and

8 a third layer intermediate the conductive and outer  
9 layers having an electrical resistivity intermediate the  
10 relatively low and relatively high electrical resistivities.

11

12 40. An intermediate transfer member according to claim 39  
13 wherein the third layer is a conforming layer having a Shore  
14 A hardness of less than about 65.

15

16 41. An intermediate transfer member according to any of  
17 claims 9-40 wherein the outer layer is a release layer for  
18 toner.

19

20 42. Imaging apparatus for performing an imaging process,  
21 comprising:

22 an imaging surface having a liquid toner image  
23 comprising toner particles and carrier liquid formed  
24 thereon; and

25 an intermediate transfer member according to any of  
26 claims 9-31, which receives the toner image from the imaging  
27 surface and from which it is subsequently transferred.

28

29 43. Imaging apparatus for performing an imaging process,  
30 comprising:

31 an imaging surface having a liquid toner image  
32 comprising toner particles and carrier liquid formed  
33 thereon; and

34 an intermediate transfer member, which receives the  
35 toner image from the imaging surface and from which it is  
36 subsequently transferred, comprising:

PCNS

- 36 -

1                   a layered transfer portion having a transfer  
2 surface on one face thereof which receives the toner image;  
3                   a resilient layer underlying the transfer surface  
4 which comprises a material which interferes with the  
5 operation of the imaging process;

6                   a barrier layer that is substantially impervious  
7 to the interfering material comprised in the resilient layer  
8 and is situated intermediate the resilient layer and the  
9 transfer surface.

10  
11 44. Imaging apparatus according to claim 43 wherein the  
12 barrier layer comprises at least partially hydrolyzed  
13 polyvinyl alcohol.

14  
15 45. Imaging apparatus according to claim 43 or claim 44  
16 wherein the barrier layer is a barrier layer for gasses.

## INTERNATIONAL SEARCH REPORT

Intern. Application No.  
PCT/NL 95/00188A. CLASSIFICATION OF SUBJECT MATTER  
G 03 G 15/16

According to International Patent Classification (IPC) or to both national classification and IPC 6

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

G 03 G, B 41 F, G 03 F

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

| Category * | Citation of document, with indication, where appropriate, of the relevant passages   | Relevant to claim No.                           |
|------------|--|---|
| Y          | US. A, 5 089 856<br>(LANDA) 18 February 1992<br>(18.02.92),<br>fig. 1, 3A, 3B, 3C;<br>column 6, lines 19-57<br>figs; abstract; claims<br>(cited in the application). | 1, 2,<br>9, 10                                  |
| A          |  | 4-6,<br>11, 26,<br>28, 33,<br>35, 36,<br>42, 43 |
| Y          | --   | 1, 2,<br>9, 10                                  |
| A          | US. A, 4 873 926<br>(SIMETH) 17 October 1989<br>(17.10.89),<br>fig. 1-3; abstract;<br>column 2, line 48 -<br>column 3, line 6.<br>the whole document.                | 3-7,<br>11-13                                   |

 Further documents are listed in the continuation of box C. Patent family members are listed in annex.

## \* Special categories of cited documents :

- \*'A' document defining the general state of the art which is not considered to be of particular relevance
- \*'E' earlier document but published on or after the international filing date
- \*'L' document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*'O' document referring to an oral disclosure, use, exhibition or other means
- \*'P' document published prior to the international filing date but later than the priority date claimed

- \*'T' later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- \*'X' document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- \*'Y' document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
- \*'&' document member of the same patent family

Date of the actual completion of the international search  
31 August 1995

Date of mailing of the international search report

- 6. 10. 95

## ANHANG

**zum internationalen Recherchenbericht über die internationale Patentanmeldung Nr.**

## ANNEX

to the International Search Report to the International Patent Application No.

## ANEXE

au rapport de recherche internationale relatif à la demande de brevet international n°

FCT/NL 95/00188 SAE 110008

In diesem Anhang sind die Mitglieder der Patentfamilien der im obengenannten internationalen Recherchebew angeführten Patentdokumente angegeben. Diese Angaben dienen nur zur Unter richtung und erfolgen ohne Gewähr.

This Annex lists the patent family members relating to the patent documents cited in the above-mentioned international search report. The Office is in no way liable for these particulars which are given merely for the purpose of information.

La présente annexe indique les  
memores de la famille de brevets  
relatifs aux documents de brevets cités  
dans le rapport de recherche inter-  
national visé ci-dessus. Les renseigne-  
ments fournis sont donnés à titre indica-  
tif et n'engagent pas la responsabilité  
de l'Office.
